Project Title: Smart Village: Day and Night Scenario

Project Description:

This project presents a smart village environment designed using computer graphics. The scene shows a beautiful village with houses, roads, trees, a school, a river, mountains,vehicles, street lights, and weather effects. The project includes both **day and night scenarios**, where the environment, lighting, sky, houses, and street lights change according to the time of day. The rain will also have animation to make the village scene more realistic and interactive.

Discussion:

The main purpose of this project is to demonstrate how computer graphics can be used to create an interactive and realistic village environment. The project will focus on drawing different village elements and implementing animations and scene transitions. The day and night modes will provide different visual appearances, while animated rain, cars, and lighting will make the scene more dynamic. The project will also demonstrate proper object positioning and layering so that roads, trees, buildings, mountains, water, and other objects appear naturally in the scene.
